

CIVL 498

LCA of UBC Buildings

Final Presentation Outline

- Goal & Scope
- The Work
 - OnScreen TakeOff
 - Impact Estimator
 - Methods
- Results
 - Initial Results
 - Influencing Factors
 - Functional Units
 - Sensitivity Analysis
 - Energy Analysis
- Recommendations

Goal and Scope

Scope

- Physical
 - Structural
 - Envelope
 - Operating energy
- Life Cycle Stages
 - “cradle to gate”

Outputs

- Create a materials inventory for each building or complex

- OnCenter's
(Jess)

- Estimate environmental impacts

- Athena Sustainable Materials Institute's
(Ivan)

- Methods (Jack)

Functional Unit

- Per square foot finished floor area

Academic

Residence

Impact Assessment

- Used Tool for the Reduction of Chemical and other environmental Impacts (TRACI) (Tyler)
 - Non-regionalized version

Summary Measures Included

- **Global warming potential**
- **Acidification potential**
- **Eutrophication potential**
- **Ozone depletion potential**
- **Photochemical smog potential**
- **Human health respiratory effects potential**
- **Weighted raw resource use**
- **Primary energy consumption**

Further Analysis

- Sensitivity (Ross)
 - Change in material volume
- Energy Modeling (Robyn)

Outcome

- Generate baseline data on estimated environmental impacts
- Use baseline as a reference for future performance upgrades

Intended Audience

- UBC Policy Makers
 - Use study to help create effective policies and frameworks
- Others Interested in LCA
 - Developers
 - Architects
 - Engineers
 - Municipalities
 - Institutions
 - Use study as a model for how to conduct an LCA

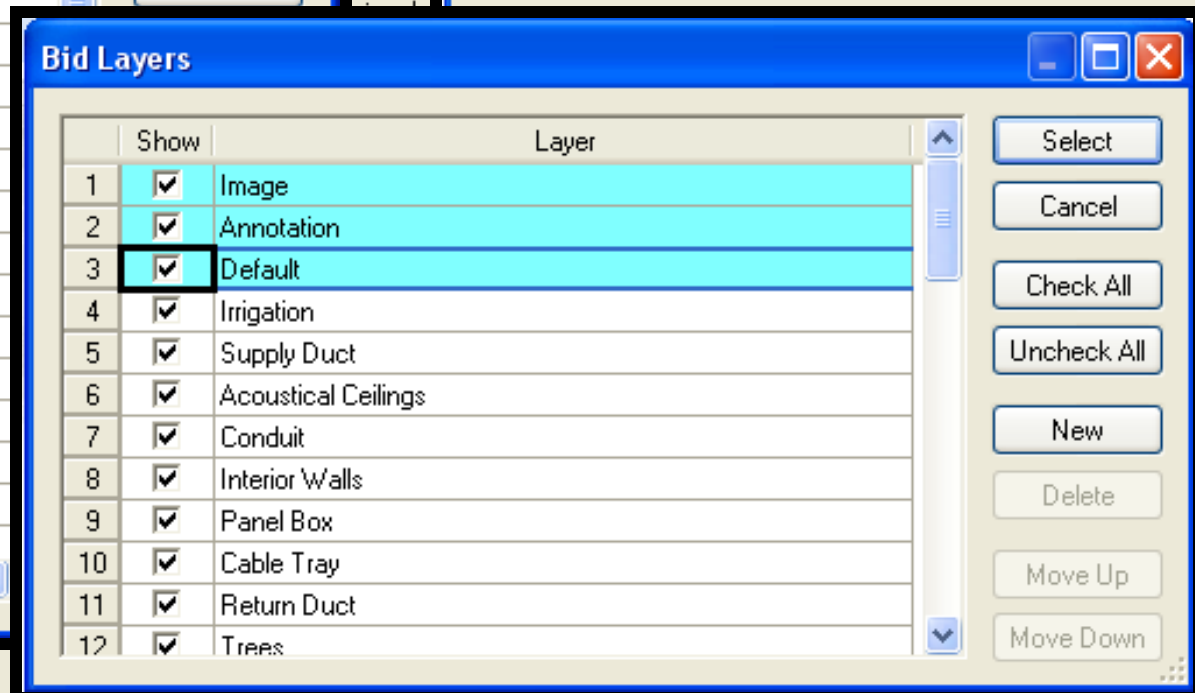

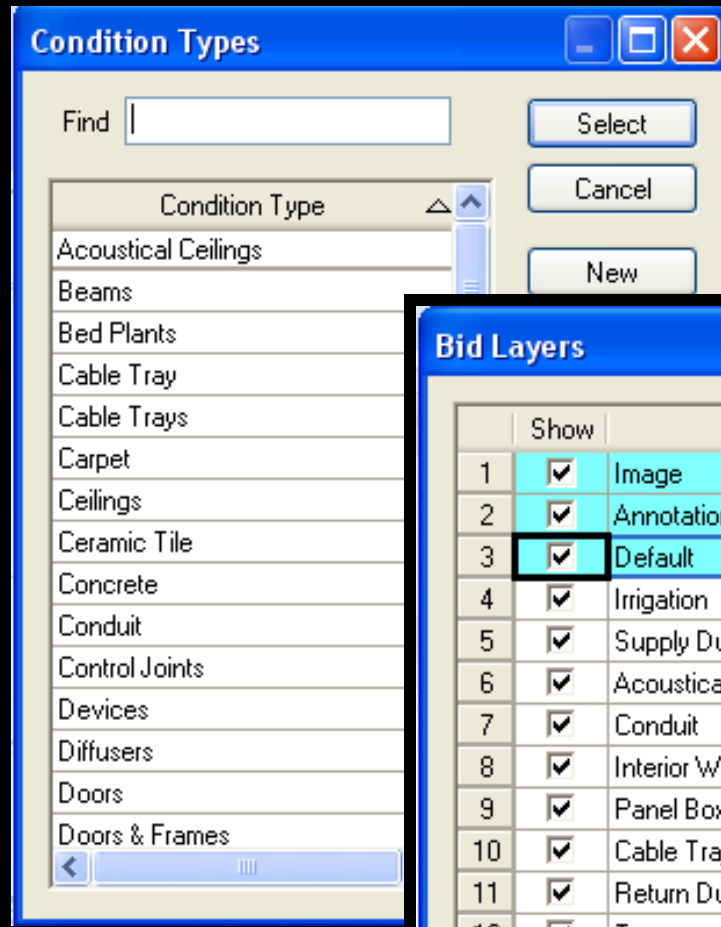

And now for some explaining!!

On Center's On-Screen Takeoff Pro

- Used to perform material takeoffs in an efficient and accurate manner

- Once you take

Area Conditions

The background of the slide is a detailed architectural floor plan of a building, showing various rooms, corridors, and structural elements. A small blue rectangular area is highlighted on the left side of the plan, indicating the location of the 'Condition Properties' dialog box.

Methods for Columns and Beams

- Used area and count conditions for odd-shaped floor areas

Methods for Columns and Beams

- Used linear and count conditions for square and rectangular floor areas

- Measure the length and width of the floor area, and count the columns and beams

- $\text{Span} = \text{Width} / \# \text{ of beam rows}$

- $\text{Bay Size} = \text{Length} / \# \text{ of columns}$

Methods for Columns and Beams

- Used the count condition for other floor areas

Methods

- Outline
 - Learning Curve
 - Generic Assumptions
 - Challenges

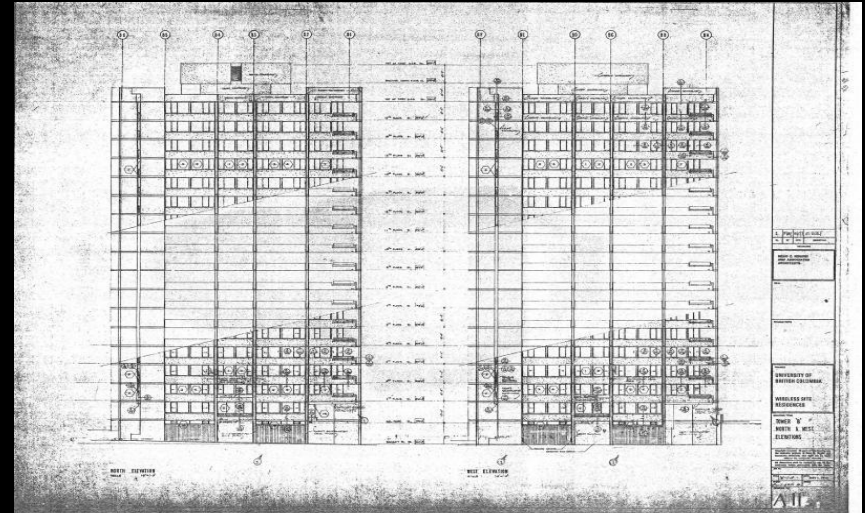

Learning Curve

- The project required a great deal of learning not only from the programs to be used, but the general concept of LCA itself
- Learning Curve for
 - Construction drawings
 - Onscreen Takeoff
 - Athena EIE
 - Data analysis for EIE (sensitivity analysis, building performance model)
 - Formatting inputs for Takeoffs and EIE

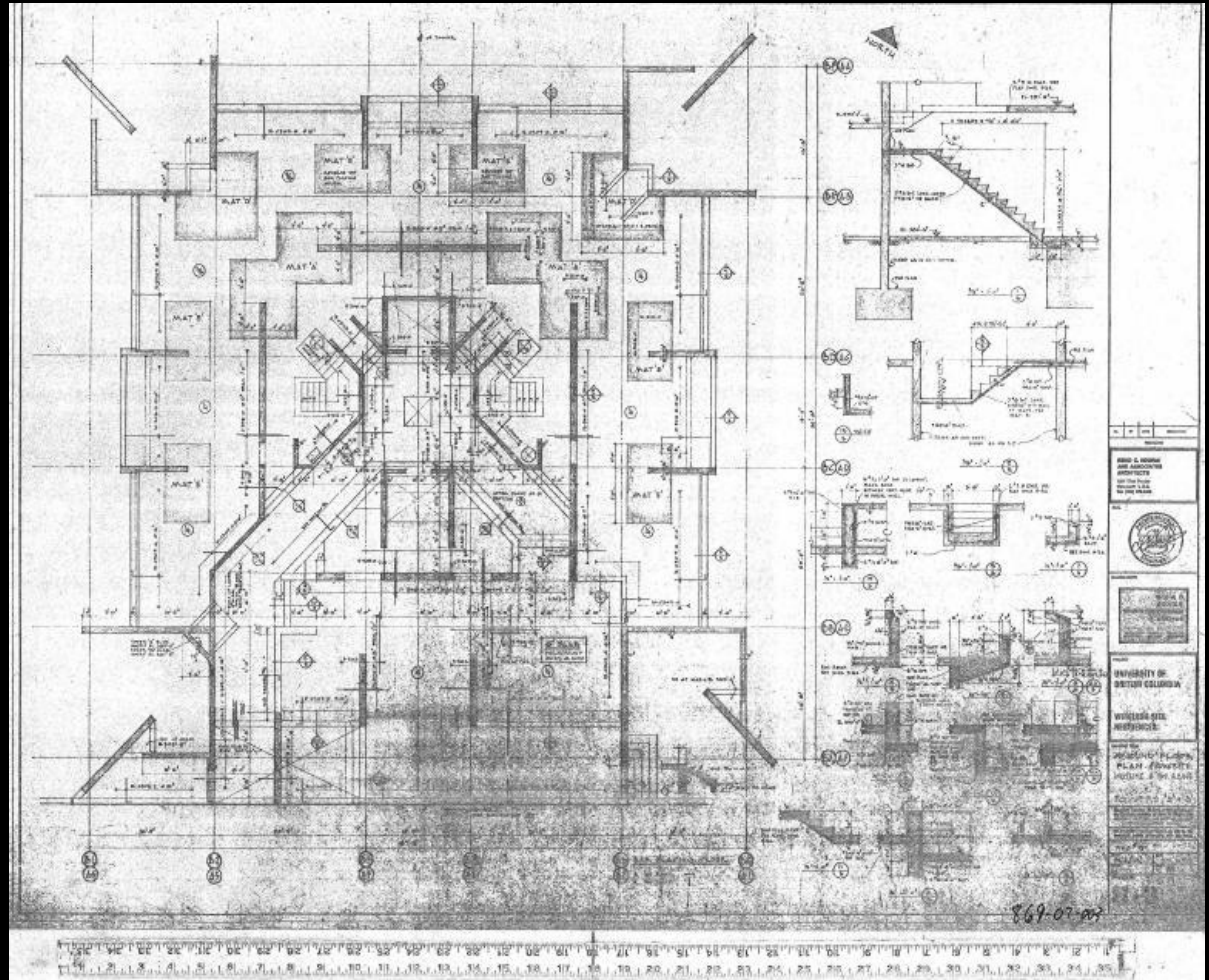

Generic Assumptions

- Use of typical floors to represent repeated floors
- Personalized modelling of complex conditions
- Assuming missing material details
 - Insulation, concrete, steel details/specifications

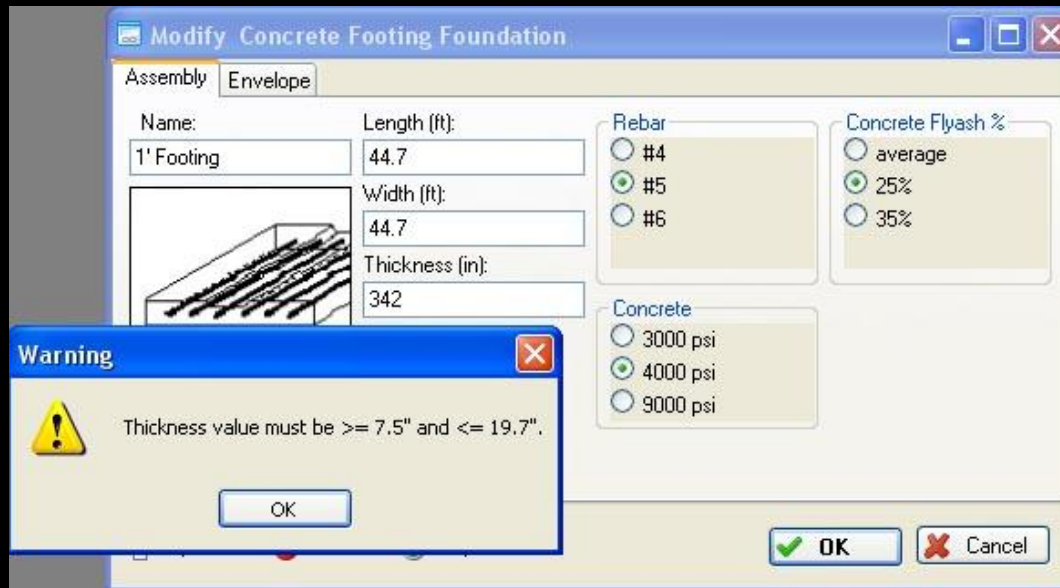

Construction Drawings Challenges

- Missing drawings
- Blurry drawings

Athena EIE Challenges

- General Challenges
 - Beam and Column Modelling
 - Material Database (concrete strength, wall thickness selection)
 - Complex structure modelling (stairs, unique truss column structures)
- Version Challenges
 - Limit of 100 window per wall assembly for Athena software
 - General boundary limits for certain inputs
 - Span limits (No error for going over limit)
 - Footing thickness (7.5"-19.7")

Formatting Challenges

- Nomenclature for takeoffs and EIE inputs
 - Nomenclature should be easy to understand
 - Should be the consistent for both programs for transparency
 - Allows anyone to carry the project into further detail with ease

Methodology in Summary

- Tasked with large project upfront that requires some planning but ultimately mistakes are inevitable
- A cyclic approach, where mistakes, inappropriate errors/assumptions are made and gone back to be fixed

Primary Energy Consumption

- All forms of energy, direct and indirect, that used to process the raw materials into the building product and transport it.
- Measured in megajoules (MJ)

Acidification Potential

- Acidification is a predominately regional impact that can affect human health when NO_x or SO_2 reach high concentrations
- Expressed as a hydrogen ion equivalency based on mass balance calculations

Global Warming Potential

- The CO₂ equivalence for other greenhouse gases is a ratio of the heat trapping potential to CO₂, affected by a time horizon as different compounds have different reactivity in the atmosphere.
- Expressed in terms of CO₂ equivalence by weight

Human Health Respiratory Effect Potential

- Particulates can have a dramatic affect on human health due to respiratory problems
- The Impact Estimator uses TRACI's "Human Health Particulates from Mobile Sources" characterization factor to account for the mobility of particles of different sizes, thus equivocated them to a single size: $\text{PM}_{2.5}$

Ozone Depletion Potential

- The ozone layer absorbs most UV radiation
- Expressed in mass equivalence of CFC-11, based on their relative capacity to damage ozone in the stratosphere

Photochemical Ozone Creation Potential (Smog)

- Under certain climate conditions when air emissions are trapped at ground level and are exposed to sunlight as a result of the interaction of volatile organic chemicals (VOCs) and nitrogen oxides
- Expressed in terms of mass of nitrogen oxide equivalence

Eutrophication Potential

- Proliferation of photosynthetic plant life potentially choking out other aquatic life and/or producing other effects such as foul odors.
- Expressed in terms of mass equivalence of nitrogen

Weighted Resource Use

- An indication of the natural resources harvested from the earth to make materials like steel and concrete
- Expressed in what can be thought of as “ecologically weighted kilograms” that represent relative levels of environmental impact based on expert opinion.

Results – Influencing Factors

Academic Buildings

Why the summary measure difference between concrete and wood?

One step of the concrete production process before batching

<http://media-2.web.britannica.com>

Dimensional lumber process

→ Harvest trees → Sawmill → Planer mill → Kiln drying → Shipping

Influencing Factors Residence Buildings

Embodied Energy Per Square Foot

High-rise
construction difficult
to compare

Sensitivity analysis
reveals concrete more
significant than wood

Concrete

Wood

Concrete
& Wood

Concrete

Wood Vs. Concrete - Academic

More input intensive
manufacturing processes =
greater emission amounts

Summary Measures (per sq. ft.)

■ Concrete Construction
■ Wood Construction Buildings

Wood vs. Concrete - Residential

Residential Vs. Academic Buildings

How would these results appear using a different unit of measurement?

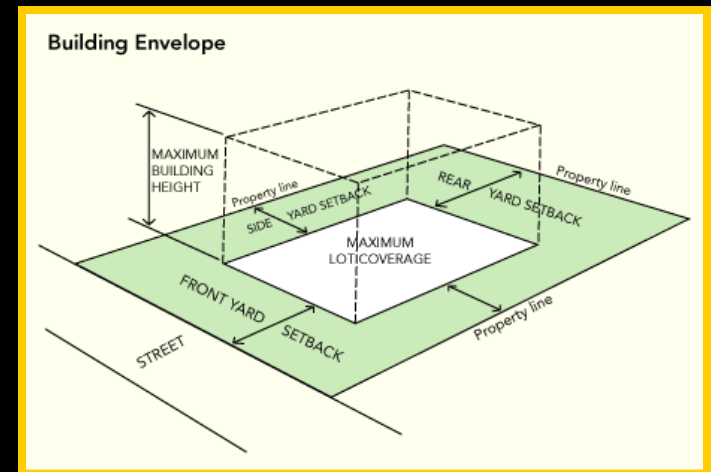

Laurent – Functional Units

Functional Units

Impacts / ft² Academic & Impacts / ft² Residence

- How well does it account for different constructions types?
- Is a multi storey building equivalent to a one storey building with an equivalent area?
- Can there be additional ways to compare our results to improve our understanding of the impacts

Floors Occupancy Productive Use

Embodied Energy/ Floor Area

- Academic and Residence
- Construction type
 - Structure
 - Interior Wall

Buildings

WW	Geography
CW	Hennings, Buchanan, Fairview, Thunderbird
CC	HR-MacMilan, CEME, Totem
CS	FSC, AERL, Gage, Marine Drive
CB	Vanier

Construction Type Comparison

Embodied Energy / # Beds

- Determines how well the building is being used
 - A building with labs may be better categories as embodied energy / room
 - A building with lots of class rooms or rooms maybe be better categories as embodied energy / occupants
- Provides a reference point for comparison

Embodied Energy Per Bed

Embodied Energy / Productive Space

- How efficiently are the material being used by the functions they serve?
 - Study area
 - Lecture Halls
 - Walkways/hallways

< Forest Science Centre >

Functional Unit

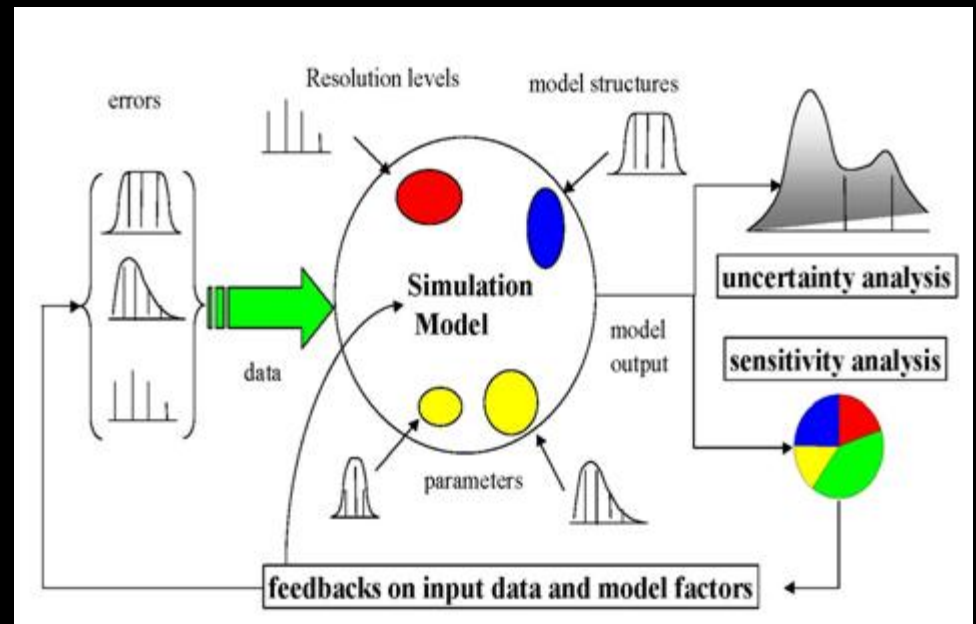

Sensitivity Analysis

- What is it?
- Process used in CIVL 498C Sensitivity Analysis
 - Results
- Importance for future design and renovation

What is Sensitivity Analysis?

- Evaluation of materials or processes to determine influence of specific components on overall system

Process used in our Analysis

- 5 most prevalent materials
- 10% variation in quantity

Results

HH Respiratory Effects Potential (kg PM2.5 eq / kg)	20631.7	1.38731	20633	6.66	35.0666	2.38334	37.45	0.40
Eutrophication Potential (kg N eq / kg)	63.0846	0.00868	63.093	1.27	0.00193	0.01509	0.017	6.01
Ozone Depletion Potential (kg CFC-11 eq / kg)	0.0321	1.3874E-07	0.0321	0.53	5.9E-10	2.5E-07	3E-07	6.81
Smog Potential (kg NOx eq / kg)	17442.9	25.951	17469	4.19	998.0	44.30	1042.4	0.26

Importance to future design and renovation

- Guides decisions in design and renovation phase
- Easily pinpoint materials/assemblies significantly impacting performance
- Quantitative/objective analysis
- Combine with other tools for deeper analysis

Energy Analysis

The energy model was defined as:

EMBODIED ENERGY + OPERATIONAL ENERGY

Energy Consumption Comparison

Analyzed Insulation Value of Exterior Components:

- Exterior Walls R-18
- Windows R-3.45
- Roof R-40

Upgrade Standard – UBC Residential
Environmental Assessment Program
(REAP) Guidelines

Not Taken into Account

- Economic Analysis
- Maintenance Cycles

- Feasibility of Installation

The Hennings Building Cumulative Energy Usage Vs Time

Percent Increase in R-Value vs. Payback Period

Further Analysis

- This is a sample of an expletory study of what can be done with LCA
- This study utilized the basics of embodied and operational energy analysis

Where Can We Go?

Manufacturing

Basic Materials

Construction

Full Life Cycle

Manufacturing

Basic Materials

Construction

Maintenance

Operating Energy

End-of-Life

Different Materials

Manufacturing

Basic Materials

Construction

Finishing Materials

Maintenance

Furniture

Operating Energy

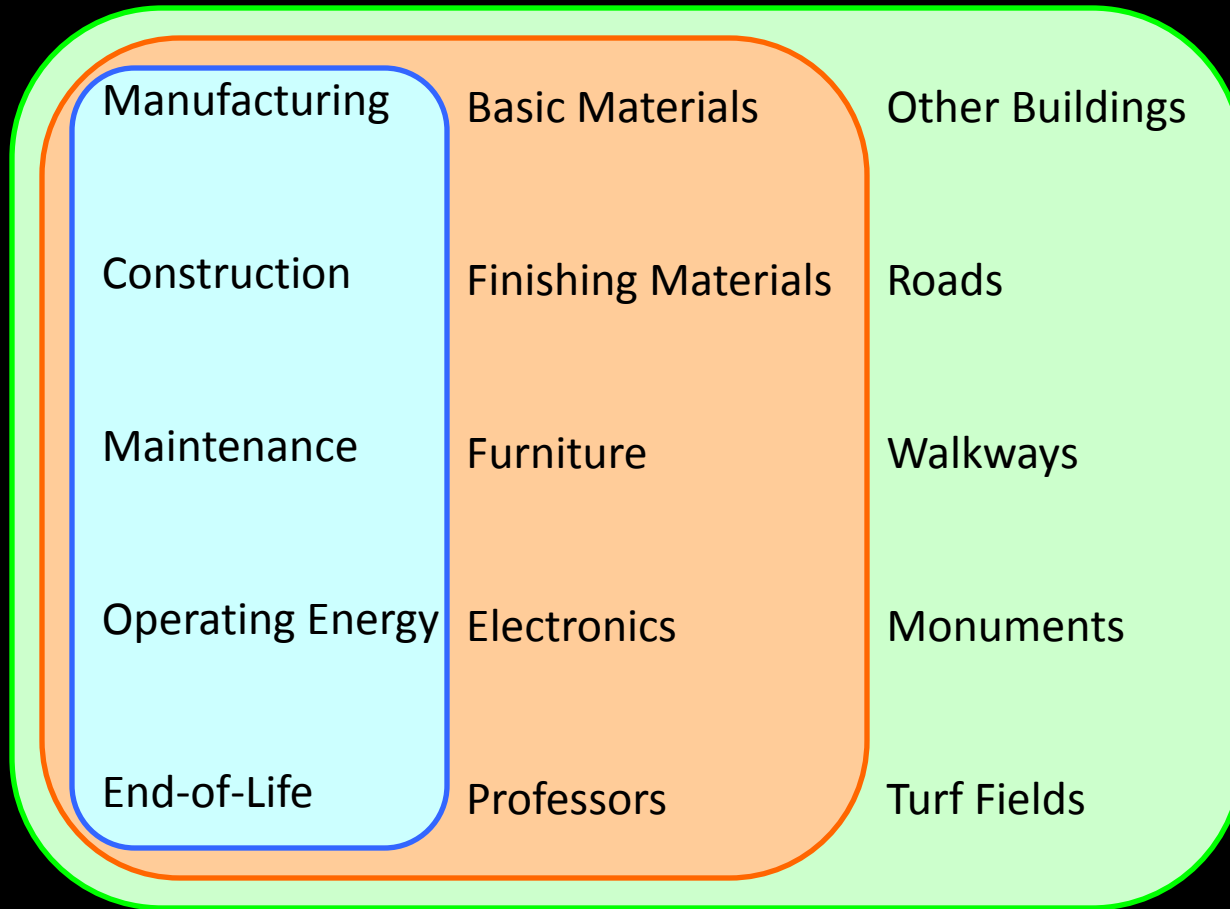

Electronics

End-of-Life

Professors

Other Structures

Future Applications

Economic payback

- Money talks
- Private sector interest in LCA will depend on it
- Useful for renovations as well as new construction

Future Applications

Standards and Policies

- The development of standards and rating systems such as REAP, LEED, etc.
- LEED 2009 contains a section for LCA

Future Applications

Quantifying Green

- LCA gives credibility to claims of being green
- Compare UBC with other universities
- Compare UBC with private sector buildings

Photo by Trevor Curtis

Future Applications

Holistic approach

- LCA is only part of the story
 - Functional land use efficiency (important in high population regions)
 - Site planning (green space, parking, storm water management etc.)

Future Applications

Enhance the study by including:

- Mechanical Engineering
- Electrical Engineering
- Architecture
- City planning
- Construction techniques
- Green materials and practices

Thank You!
